Re: Montrose Part 2, Phase 2A, Field Data Submittal, Volume Four

Dear Ms. Miller:

Please find enclosed Volume Four of the field data submittal for the Montrose Part 2, Phase 2A remedial investigation. Volume Four contains field data collected during the groundwater-related activities portion of the Part 2, Phase 2A remedial investigation. Specifically, this volume includes field data for exploratory borings, monitor well construction, and two groundwater sampling rounds. Volumes One through Three of the Part 2, Phase 2A field data submittal were provided to the EPA in December, 1988.

Please contact me if you have any questions regarding this submittal.

Sincerely,

HARGIS + ASSOCIATES, INC.

Roger A. Niemeyer
Senior Hydrogeologist

VOLUME FOUR
OCTOBER 1988 - FEBRUARY 1989
MONITOR WELL CONSTRUCTION AND SAMPLING

INTRODUCTION

The following are field data collected during the Part 2 Phase 2A Remedial Investigation work conducted at and in the vicinity of the Montrose Chemical Company (Montrose) Site in Torrance, California. This is the fourth volume of field data submitted during the Part 2 Phase 2A Remedial Investigative work. The previous volumes submitted contained field data collected during the Dominguez Channel sediment survey and sampling, the off-site soil sampling and the on-site soil sampling. Field work was conducted in accordance with the EPA approved May 20, 1988 Sampling Plan and QAPP. This March 1989 submittal consists of field data collected during the exploratory borings, monitor well installation, and groundwater sampling tasks.

Volume four of the Phase 2A data submittal includes lithologic logs of exploratory borings and monitor wells, organic vapor analyzer (OVA) results, geophysical logs, well construction data, groundwater sampling data, and a monitor well location map.

EXPLANATION FOR LOGS

Soil descriptions were compiled based on soil obtained from the standard penetrometer split-tube sampler (SPT sampler), continuous core device, or mud rotary cuttings. Blow counts for the SPT sampler were recorded per 6-inch interval penetrated. Sample recovery was recorded as the ratio of soil recovered to the total interval driven or cored. Color was described using the Munsell Soil Color Chart. Grain size was estimated using ASTM standards D422-63, D643-78 (American Geological Institute, 1982).

HARGIS + ASSOCIATES, INC.

A Foxboro OVA 128 flame ionization-type analyzer or a HNU Model 101 photo ionization-type analyzer was used for field measurement of organic vapors in the soil samples. OVA readings follow the procedures outline in the QAPP (Hargis + Associates, 1988). The OVA readings in equivalent parts per million of methane are presented on the logs at the depth interval sampled. The OVA background readings are deducted when reported soil values are below 50 ppm.

The lithologic logs for exploratory borings EB-2A and EB-3 through EB-6 are a compilation of drill cutting and borehole geophysics data. The remaining lithologic logs are based solely on field soil descriptions. Monitor well locations are depicted on Figure 5.

DESCRIPTION OF DRILLING

An Ingersoll-Rand TH 100 mud rotary drill rig equipped with a 5 1/2-to 6 1/4-inch bit was used to drill exploratory borings EB-2A, EB-3, EB-4, EB-5, and EB-6. Samples were collected using a Christenson wireline core barrel or from the mud rotary cuttings. Natural gamma, spontaneous potential, point resistivity, and 6-foot lateral resistivity logs were run in each exploratory boring. Geophysical logs are included in Appendix N of this submittal. Exploratory borings were abandoned by pressure cementing from the bottom of the hole to the land surface with neat cement.

A CME 75 hollow-stem auger rig equipped with 10-inch O.D. by 6 1/8-inch I.D. augers was used to construct the upper Bellflower aquitard monitor wells MW-6 and 7 and MW-10 through 15. Soil samples were collected at selected intervals with an SPT sampler for lithologic description. The SPT sampler was advanced using a 140-pound hammer falling 30 inches.

Fifteen feet of 4-inch nominal 316L stainless steel wire wrap well screen with a slot size of 0.020 inches was installed in each upper Bellflower aquitard well. Four-inch nominal schedule 40 PVC well casing was

HARGIS + ASSOCIATES, INC.

installed above the screen in each upper Bellflower aquitard well. Monterey #1C sand was used to filter pack the screened interval. The filter pack was installed to between 3.3 to 6.9 feet above the screened interval. Hole Plug granular bentonite or Volclay 1/4-inch pellets were installed and hydrated to provide the bentonite seal. Approximately 1 foot of silica #60 fine sand was emplaced above the bentonite seal to provide a grout filter. A nine-sack sand/cement slurry was used to backfill the well annulus from the grout filter to land surface. All wells were equipped with locking lids and Christy vaults except MW-14, which was completed above ground.

A Gardner-Denver mud rotary drill rig was used to construct the Bellflower sand and Gage aquifer monitor wells. Cutting samples were collected from the mud rotary fluid returns for lithologic description. The samples collected were used to verify the lithology observed at the exploratory borings.

Drilling operations for Bellflower sand and Gage aquifer monitor wells typically lasted three days. The first day's work entailed setting up at the new location, drilling to conductor casing depth with an 8-inch pilot bit and then reaming to the conductor casing depth with a 13 3/4-inch reamer bit. The second day's operation entailed welding 8 5/8-inch conductor casing and pressure cementing the conductor casing/borehole annular space with neat cement. The third day's work entailed mixing fresh mud and drilling to total depth with a 6-inch pilot bit and then under reaming with a 12-inch under reamer bit to total depth. Well casing installation is described in detail in the following paragraphs. The well casing/conductor casing annular space was grouted with Baroid Benseal or Volclay grout. See Table 0-2 for specific well construction details.

Bellflower sand monitor wells BF-5 through BF-8 were installed with 10 feet of 4-inch nominal 316L stainless steel wire wrap well screen. Slot size and filter pack were either 0.020-inches and #1C sand or 0.045-inches and medium aquarium sand depending upon lithologic conditions encountered at individual well sites. Ten feet of 4-inch nominal 316L stainless steel

HARGIS + ASSOCIATES, INC.

0
G
Z
W

blank casing was installed above the screen in each Bellflower sand well. Four-inch nominal schedule 40 PVC casing was installed from the blank stainless steel casing to land surface. Either #60 silica sand or bentonite pellets were installed above the filter pack.

On-site at monitor well BF-9, 6-inch nominal well casing and screen were installed to permit the option of using the well as an extraction well. Twenty feet of screen were installed in the well. The lower 10 feet of screen has a slot size of 0.045 inches and has medium aquarium sand as a filter pack. The upper 10 feet of screen has a slot size of 0.030 inches and has a #3 sand as a filter pack. Sixty feet of blank 316L stainless steel casing was installed above the well screen. Approximately 50 feet of 6-inch nominal schedule 40 PVC casing was installed above the blank stainless casing to land surface.

Gage aquifer monitor wells G-4 through G-7 were installed with 40 feet of 4-inch nominal 316L stainless steel wire wrap well screen. A 0.020-inch well screen and #1C filter pack sand were installed in each well. Ten feet of 4-inch nominal 316L stainless steel blank casing was installed above the screen in each well. Four-inch nominal schedule 40 PVC casing was installed above the blank stainless steel casing to land surface. Either a silica sand #60 or bentonite pellets were installed above the filter pack. Lower Gage aquifer monitor well LG-2 was constructed in a manner similar to the other Gage aquifer monitor wells but has only 20 feet of well screen.

WELL DEVELOPMENT PROCEDURES

Phase 2A monitor wells were developed in two stages, referred to as preliminary and final development. Preliminary development was conducted shortly after each monitor well was constructed. The objective of the preliminary development was to remove water or drilling fluid introduced during construction from the well. Upper Bellflower aquitard monitor wells

HARGIS + ASSOCIATES, INC.

preliminary development was to remove water or drilling fluid introduced during construction from the well. Upper Bellflower aquitard monitor wells were bailed within 24 hours of well completion. The volume of water removed was equivalent to or greater than the volume of water used to stabilize the boring during well construction. Bellflower sand and Gage aquifer monitor wells were pumped with an electric submersible pump or bailed within 24 hours of completion to remove drilling fluids from the well. Approximately 100 to 250 gallons of water were removed from each Bellflower sand and Gage aquifer monitor well during preliminary development.

Final development was conducted one to ten weeks after well completion. The objective of the final development was to remove fine-grained particles from the filter pack and the formation immediately adjacent to the well. During final development, Phase 2A wells were developed by bailing, swabbing, and pumping. Each well was bailed using a suction bailer to remove the sediment from the well. After bailing, the screened interval was swabbed in discrete intervals. When necessary, the suction bailer was utilized again to remove the sediment. This procedure was repeated as necessary.

After bailing and swabbing, the wells were pumped until the water was clear. The static water level, discharge rate, and pumping duration were recorded.

PUMP SETTING PROCEDURES

All monitor wells constructed during Phase 2A were fitted with dedicated purge pumps and sample pumps. The upper Bellflower aquitard wells have a QED Model HR4200 Purge Master pump and a QED Model T1200 bladder pump. The Phase 2A Bellflower sand and Gage monitor wells have Grundfos nominal ten gallons per minute electric submersible purge pumps. The sample pump is a QED Model T1200 bladder pump.

HARGIS + ASSOCIATES, INC.

GROUNDWATER SAMPLING

This section contains field data generated during the January 30-February 3, 1989 and February 6-10, 1989 groundwater sampling rounds at the Montrose site. Groundwater sampling was conducted in accordance with the EPA-approved May 20, 1988 Sampling Plan and QAPP.

Sampling conducted from January 30 to February 3, 1989 was limited to the newly installed off-site monitor wells and on-site BF-9 and LG-2 monitor wells. Water levels were measured at all monitor wells except for MW-2. Sampling conducted from February 6-10, 1989 included all on-site and off-site monitor wells. Water levels were measured at all monitor wells.

Groundwater samples, including duplicate samples, collected during the two sampling rounds were submitted to Brown and Caldwell Laboratories in Pasadena, California for pesticide (EPA Method 608/8080) and volatile organic compound (EPA Method 624/8240) analyses. Field blanks submitted to Brown and Caldwell Laboratories were analyzed for pesticides (EPA Method 608/8080) and volatile organic compounds (EPA Method 624/8240). Trip blanks, submitted to Brown and Caldwell Laboratories were analyzed for volatile organic compounds (EPA Method 624/8240). Laboratory split samples collected in the field during this sampling round were submitted to Analytical Technologies, Inc. in San Diego for pesticide (EPA Method 608/8080) and volatile organic compound (EPA Method 624/8240) analyses. Additional samples were collected during the February 6-10 sampling round from the recently installed Phase 2A monitor wells for common ion and nitrate analysis. These samples were also submitted to Brown and Caldwell Laboratories for analysis.

Mud Rotary Cuttings	NA	NA	253-255 CLAYEY SAND (SC): Dark blue gray, dense, fine- to medium-grained, subdiscoidal to subprismoidal, angular to subrounded.
			255-260 SAND (SW): Gray, 5Y 6/1, dense, fine to coarse, predominantly medium to coarse, trace silt, trace gravel to 1/2-inch, subprismoidal and rounded, quartzitic chert, gneissic and granitic grains and pebbles.
			260-283 GRAVELLY SAND (SG): Gray, 5Y 6/11, dense, fine to coarse sand, predominantly coarse sand and gravel, some sandy silt interbeds.
			283-317 SANDY SILT AND SAND INTERBEDS (ML/SP): Sand silt is blue gray, firm to stiff, slightly plastic. Sand is olive gray, fine to coarse, predominantly medium-grained, subprismoidal and rounded.

1 Blow counts per 0.5 foot interval using a California modified drive sampler and a 140-pound hammer with a 30-inch drop. Recovery = length of sample in sampler/length of sampler driven or cored, measured in feet.

2 Organic vapor analyzer (OVA) readings in parts per million (ppm) of soil collected at depth indicated.
OVA background readings deducted when reported values are below 50 ppm.

<u>DRILLING/SAMPLING METHOD</u>	<u>BLOW COUNTS; RECOVERY¹</u>	<u>OVA² (ft/ppm)</u>	<u>DEPTH INTERVAL (feet) AND DESCRIPTION</u>
Mud Rotary Cuttings	NA	NA	188-194 FOSSILIFEROUS SAND (SP): Blue gray, fine-grained sand, abundant shell fragments of gastropods and bivalves, some intact shells, some silty sand interbeds.
			194-200 CLAYEY SILT (ML): Blue gray, stiff, trace fine-grained sand, moderately plastic.
			200-210 SAND (SP): Blue gray, dense, fine-grained, some clayey silt interbeds, same as 194 to 200 feet.
			210-215 CLAYEY SILT (ML): Same as 194 to 200 feet.
			215-220 SILTY SAND (SM): Gray, 5Y 6/1, dense, fine- to medium-grained sand, subdiscoidal to subprismoidal and subangular to subrounded.

1 Blow counts per 0.5 foot interval using a California modified drive sampler and a 140-pound hammer with a 30-inch drop. Recovery = length of sample in sampler/length of sampler driven or cored, measured in feet.

2 Organic vapor analyzer (OVA) readings in parts per million (ppm) of soil collected at depth indicated.
OVA background readings deducted when reported values are below 50 ppm.

(ft/ppm)DEPTH INTERVAL (feet)
AND DESCRIPTION

The lithology for MW-14 is presented in exploratory boring EB-5. The lithologic log for exploratory boring EB-5 is reported in this appendix, Table M-4. The following is the detailed lithology obtained from drive samples collected while drilling the monitor well.

Drive Sampler
42-43.59/12/16;
R=1.5/1.5

42.5/0.5

42.0-42.5 SAND (SP): Yellowish brown, 10YR 5/4, slightly moist, dense, fine-grained.

42.5-43.5 CLAYEY SILT (ML): Olive, 5Y 5/3, slightly moist, stiff, slightly plastic, some silty sand interbeds 0.1 feet thick, dark yellowish brown, 10YR 4/6, slightly moist, dense, trace mica, some orange oxide staining.

Drive Sampler
63.0-65.035/45/34/-
42;
R=2.0/2.0

62-63.5/0.1

63.0-65.0 SAND (SP): Light brownish gray, 2.5Y 6/2, slightly moist, very dense, fine-grained, trace mica, trace silt, increase in moisture at 64.8 feet.

- 1 Blow counts per 0.5 foot interval using a standard penetrometer split-tube sampler and a 140-pound hammer with a 30-inch drop. Recovery = length of sample in sampler/length of sampler driven or cored, measured in feet.
- 2 Organic vapor analyzer (OVA) readings in parts per million (ppm) of soil collected at depth indicated. OVA background readings deducted when reported values are below 50 ppm.

Notes

gpm = gallons per minute

--- = In order to preserve field equipment, parameters were not measured in water with high target chemical concentrations.

+ = Approximately 240 ml of dense free product was purged from bottom of well. A sample of free product was submitted to the lab for analysis.

VOLUME THREE
SEPTEMBER 1988 - NOVEMBER 1988
ON-SITE SOIL SAMPLING

INTRODUCTION

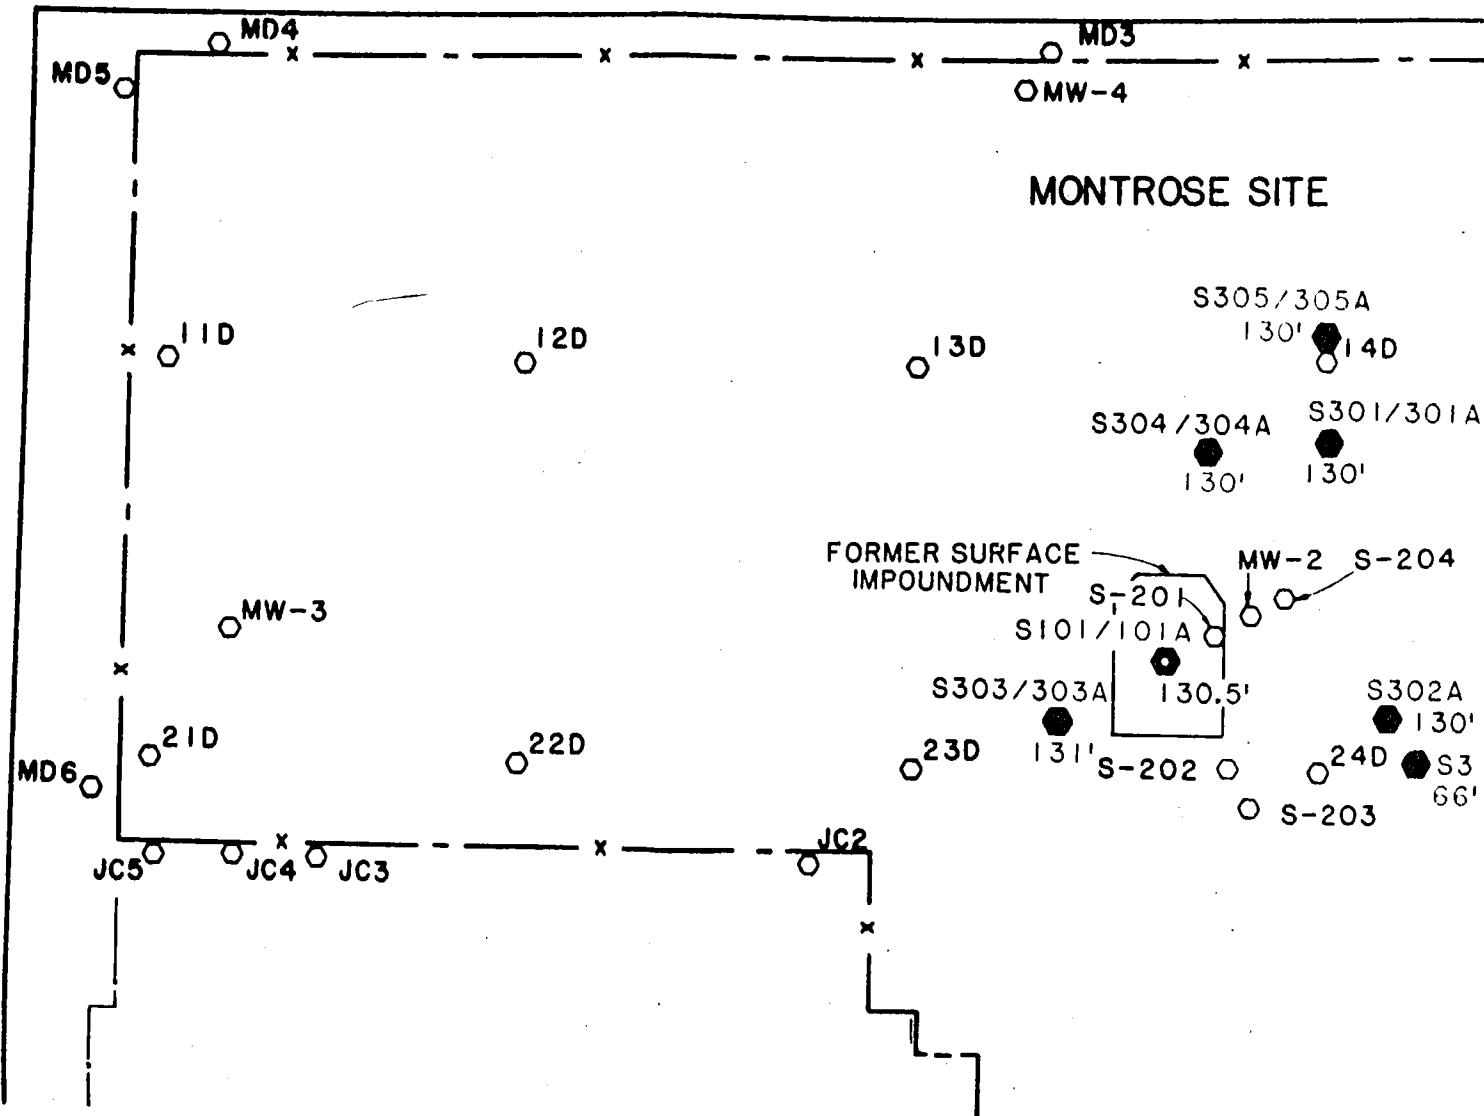

The following are field data collected during the Part 2 Phase 2A Remedial Investigative Work conducted at and in the vicinity of the Montrose Chemical Company (Montrose) site in Torrance, California. This December 1988 submittal consists of three volumes, respectively containing field data collected during the Dominguez Channel sediment survey and sampling, the off-site soil sampling, and the on-site soil sampling activities. A fourth volume containing field data collected during Part 2 Phase 2A monitor well installation and groundwater sampling activities will be submitted in early 1989 subsequent to the completion of those activities. The companion raw analytical data submittals will also be organized in four volumes in parallel to the field data submittal.

Volume three of the Phase 2A data submittal includes lithologic logs of on-site soil borings, on-site soil sample identification tables, OVA results and a soil boring location map. On-site soil borings were drilled in two episodes. The upper 60 feet of soil was sampled and logged using a hollow-stem auger drill rig. Soil exploration below 60 feet was accomplished using a Christenson wireline core barrel. On-site soil samples were submitted to Brown and Caldwell Laboratories in Pasadena for analysis.

EXPLANATION FOR LOGS	J-1

EXPLANATION FOR LOGS

Soil description were compiled based on soil obtained from the split tube sampler or the continuous core device. Blow counts for the split tube sample were recorded per 6-inch interval penetrated. Sample recovery was recorded as the ratio of soil recovered to the total interval driven or cored. Color was described using the Munsell Soil Color Chart while grain size was estimated using the June 1982 American Geological Institute Data Sheets. Sample numbers were assigned using the soil boring location followed by the depth at the lower end of the brass tube.

An Acker AD2 hollow-stem auger drill rig equipped with 8-inch O.D. augers was used to collect soil from borings S303 and S305 to a depth of approximately 60 feet. Samples were collected with a split-tube drive sampler or a hollow auger continuous core device. The split tube drive sampler was advanced using a 140-pound hammer.

A Mobil B-61 hollow-stem auger rig equipped with 8-inch O.D. augers was used to collect soil from borings S301, S302F and S304 to a depth of approximately 60 feet. Samples were collected with a split-tube drive sampler or a hollow auger continuous core device. The split type drive sample was advanced using a 140-pound hammer. Samples were taken at designated sampling intervals as specified in Table 3 of the SAP (Hargis + Associates, Inc., 1988). Cement grout slurry was used to backfill each borehole above the water table. Neat cement was used to backfill each soil boring below the water table.

A soil sample from S301B was obtained using a hand auger and a hand-driven drive sampler fitted with one 6-inch long 2-inch diameter thin-wall brass tubes.

A Longyear wire-line core barrel was used with the Acker AD2 drilling to collect soil samples below the water table in borings S303 and S305. This method of coring below the water table was discontinued due to poor

0

7
0

recovery. A Christenson core barrel was used in place of the Longyear. Because the Christenson core barrel was used with an Ingersoll-Rand TH100 mud rotary drill rig, a separate boring was drilled adjacent to the hollow-stem auger borings. Soil borings S301A, S302A, S303A, S304A, S305A, and S101A were drilled using the Christenson core barrel. Soil samples collected from the core barrel were placed in clean glass jars.

A Century Model OVA 128 flame ionization-type analyzer or a HNU Model P1 101 photo ionization-type analyzer was used for field measurement of organic vapors in the soil samples. OVA readings follow the procedures outline in the QAPP (Hargis + Associates, 1988). The OVA readings in equivalent parts per million of methane are presented on the logs at the depth interval sampled. The soil OVA background readings are deducted when reported values are below 50 ppm.

The laboratory was instructed to obtain soil aliquots for analysis from the bottom of the brass tube for the original sample and from the top of the adjoining brass tube for the duplicate and split samples. Sample identification tables are provided in Appendix L.

Soil boring locations are depicted on Figure 4.

<u>INTERVAL DRIVEN OR CORED (feet)</u>	<u>BLOW COUNTS; RECOVERY¹</u>	<u>OVA² (ft/ppm)</u>	<u>DEPTH INTERVAL (feet) AND DESCRIPTION</u>
			134.4 - 134.9 SILTY SAND (SM): SAME AS 133.0 - 134.2.
			134.9 - 135.0 SANDY SILT (SM): Gray to dark gray, 2.5 Y 5/0 - 2.5 Y 4/0, moist, dense, fine-grained, nonplastic.
			135.0 - 135.6 SILTY SAND (SM): Dark gray, 2.5 Y 4/0, with blue twinge, moist, dense, fine-grained, some orange and olive mottling.

TOTAL DEPTH OF BOREHOLE: 135.6 Feet.

- 1 Blow counts per 0.5 foot interval when using a California modified drive sampler and a 140-pound hammer with a 30-inch drop. Recovery = length of sample in sampler/length of sampler driven or cored, measured in feet.
 2 Organic vapor analyzer (OVA) readings in parts per million (ppm) of soil collected at depth indicated. OVA background readings deducted when reported values are below 50 ppm.

<u>INTERVAL DRIVEN OR CORED (feet)</u>	<u>BLOW COUNTS; RECOVERY¹</u>	<u>OVA² (ft/ppm)</u>	<u>DEPTH INTERVAL (feet) AND DESCRIPTION</u>
120.0 - 125.0	Continuous Core; R=4.8/5.0	121.5/9.5 122.5/15.5 124.5/23.5	120.0 - 120.2 SAND (SP): SAME AS 117.4 - 119.9, but medium grained, subprismoidal and subrounded grains. 120.2 - 120.8 SAND (SP): Pale olive 5 Y 6/3, moist, dense, fine to medium grained, predominantly fine-grained, some silt. 120.8 - 122.2 SAND (SP): Olive 5 Y 4/4, moist, dense, medium grained, subdiscoidal to subprismoidal and subangular to rounded, orange iron oxide bands 0.01 - 0.1 -feet in thickness. 122.2 - 124.3 SAND (SP): Olive 5 Y 4/4, moist, dense, medium-grained, subdiscoidal to subprismoidal and subrounded to rounded. 124.3 - 124.8 SAND (SP): SAME AS 122.2 - 124.3, but coarse and subdiscoidal to subprismoidal and subrounded to rounded grains.

- 1 Blow counts per 0.5 foot interval when using a California modified drive sampler and a 140-pound hammer with a 30-inch drop. Recovery = length of sample in sampler/length of sampler driven or cored, measured in feet.
 2 Soil collected at depth indicated/organic vapor analyzer (OVA) readings in parts per million (ppm). OVA background readings deducted when reported values are below 50 ppm.

TABLE K-12 (continued)
LOG OF SOIL BORING S305A

<u>INTERVAL DRIVEN OR CORED (feet)</u>	<u>BLOW COUNTS; RECOVERY¹</u>	<u>OVA² (ft/pdm)</u>	<u>DEPTH INTERVAL (feet) AND DESCRIPTION</u>
125.0 - 129.9	Continuous Core; R=4.9/5.0	126.1/7.5 129.1/6.0 129.6/6.0	125.0 - 126.2 SAND (SP): Olive 5 Y 4/4, moist, dense, fine to medium-grained but predominantly fine, subprismoidal and subrounded.
			126.2 - 128.3 SAND (SP): Olive 5 Y 5/4, moist, dense, fine to medium-grained, but predominantly medium, subdiscoidal to subprismoidal and subangular to rounded, trace coarse.
			At 126.6, hairline black lamination.
			128.3 - 129.3 SAND (SP): SAME AS 126.2 - 128.3, but olive gray 5 Y 5/2.
			129.3 - 129.9 SILT (ML) WITH INTERBED OF SILTY SAND (SM). SILT (ML): Olive 5 Y 5/6, moist, dense, nonplastic. SILTY SAND: Grey 5 Y 5/1, moist, dense, fine- to medium grained, subprismoidal and subrounded.

TOTAL DEPTH OF BOREHOLE: 129.9 FEET.

- 1 Blow counts per 0.5 foot interval when using a California modified drive sampler and a 140-pound hammer with a 30-inch drop. Recovery = length of sample in sampler/length of sampler driven or cored, measured in feet.
2 Soil collected at depth indicated/organic vapor analyzer (OVA) readings in parts per million (ppm). OVA background readings deducted when reported values are below 50 ppm.
